1. Company & Product Overview

ChatRealty (operated by JPS & Company LLC) is a multi-tenant SaaS marketing platform for licensed U.S. real estate agents. ChatRealty provisions a dedicated Google Ads account for each agent under our manager account (MCC 206-304-7113) and creates and manages Search and Video (YouTube) campaigns within it — on the agent's behalf and with their explicit, revocable consent. ChatRealty is the technology provider and account manager; the agent is the advertiser whose business the ads promote.

2. Target Audience & Business Model

- Audience: individual licensed real estate agents and small teams in the United States.
- Monetization: subscription plans plus a prepaid credit system. Agents purchase credits that fund their advertising spend and platform services.

3. System Architecture

- Account provisioning: when an agent joins, ChatRealty creates a dedicated Google Ads client account under our MCC (CustomerService.CreateCustomerClient) so the agent has no account setup to perform. Billing is consolidated under the MCC; agents prepay via credits and every campaign is budget-capped, so spend cannot exceed what the agent has funded.
- Asset linking: the agent links their own assets with one-click approvals — e.g. their YouTube channel (for video ads), website, and conversion/analytics data. Assets remain owned by the agent and access is revocable.
- Account management & isolation: every API call sets login-customer-id = MCC and operates on the specific agent's account (customer-id), so each agent's campaigns are isolated to their own account. The platform developer token is the developer-token header.
- Authentication: OAuth 2.0 (scope adwords); agents authenticate to link assets and authorize management, with revocable consent in Settings → Integrations.
- Stack: Next.js (App Router) and MongoDB; Google Ads API REST (v24).

4. Google Ads API Usage

- Services/methods: CustomerService (provision client accounts under the MCC), CampaignBudgetService (budgets), CampaignService (Search and Video campaigns), AdGroupService, AdGroupAdService (Responsive Search Ads, in-stream Video ads), AssetService (YouTube video assets), and GoogleAdsService.SearchStream for reporting.
- Campaign types: Search, Video (YouTube in-stream). Targeting is geo/radius-based for real-estate markets (cities, neighborhoods, listings).

- Volume: modest per-agent operation counts (provision, create, manage, report); well within Standard limits.

5. User Workflow

1. Agent signs up on ChatRealty.
2. ChatRealty provisions a dedicated Google Ads account for them under our MCC — no account setup for the agent.
3. Agent links their assets (YouTube channel, website, conversion data) with one-click approvals.
4. Agent builds a campaign in the ChatRealty wizard (market, budget, headlines, creative).
5. ChatRealty creates the campaign PAUSED; it is reviewed and explicitly approved before being enabled — no unattended spend.
6. ChatRealty reports campaign status and metrics back into the agent's dashboard.

6. Required Minimum Functionality (Capabilities)

- Account Creation — provision a dedicated Google Ads account per agent under our MCC.
- Campaign Creation — Search and Video campaigns, budgets, ad groups, ads.
- Campaign Management — edit/pause/enable, budget changes.
- Reporting — campaign status and performance via GoogleAdsService.

7. Data Handling, Consent & Policy Compliance

- We provision and manage an agent's account and assets only with their explicit, revocable consent.
- Agent assets and data are used solely to operate their campaigns and provide reporting; we do not sell or rent agents' data.
- Campaigns launch PAUSED for review — no unattended or unauthorized spend — and are budget-capped to the agent's prepaid credits.
- We operate within Google Ads policies and the Google Ads API Terms; agents are responsible for their ad content, and we surface policy/disapproval status to them.

8. Security

- OAuth tokens encrypted at rest; least-privilege scoping (adwords only).
- Per-account isolation under the MCC prevents cross-tenant access.
- TLS in transit; access controls on the platform.
